Somatic Cell Genetics publishes reports of original research in the field of somatic cell genetics and related fields. The primary emphasis is on in vitro animal cell studies in the following areas: gene expression and regulation, gene mapping, gene transfer and recombination, mutation, and chromosome structure and replication.

The journal welcomes studies on related topics—such as cell differentiation in vitro, enzyme induction, cell–cell and cell–virus interactions, malignancy, nucleocytoplasmic interactions, the cell cycle, cell membranes, nuclear transfer, X chromosome inactivation, embryo and germ-cell fusion, and the genetics of plant cells in vitro—if the findings are relevant to somatic cell genetics.

Papers on technical developments in areas such as cell culture, cell fusion, mutagenesis, and chromosome staining are accepted. Brief reports, letters, and review articles on topics of special interest are also published.
